What is High Resolution Manometry?

High resolution manometry (HRM) is a diagnostic procedure that measures the pressure and coordination of the muscles in the esophagus. It is used to evaluate esophageal motility disorders, which are conditions that affect the movement of food and liquid through the esophagus.

HRM is a more advanced version of conventional manometry, which uses a single pressure sensor to measure pressure in the esophagus. HRM uses multiple sensors to create a detailed pressure map of the esophagus, providing a more comprehensive view of esophageal function.

Applications of HRM

HRM is used to diagnose a variety of esophageal motility disorders, including:

- Achalasia
- Diffuse esophageal spasm
- Jackhammer esophagus
- Nutcracker esophagus
- Esophageal dysphagia
- Gastroesophageal reflux disease (GERD)

HRM can also be used to assess the effectiveness of esophageal treatments, such as surgery or medication.
